Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention of scribes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either inediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating arthritis, such diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, thrombocytopaenia purpura, colitis, contact sensitivity disease, disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical
                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

Way 82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glattramer actate invention are used as molecular weight markers for glattramer actate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases of treating and preventing immune diseases in a mammal. Autoimmune diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid archititis, osteoarchritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune viceocephic conditions, disease, chronic immune thyroiditis, autoimmune thyroiditis, autoimmune spronic particular sensitivity disease, diabetes mellitus, Graves disease, dialated conditions, demy purpura, colitis, conteat sensitivity disease, diabetes mellitus, Graves disease, dialated conditions wilgaris, or systemic lupus erythematosus. Mediated conditions wild delayed-type hypersensitivity. The mediated diseases and delayed-type hypersensitivity. The properties which are analogous to glativamer actate molecules, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

Weight TV-marker polypeptides from the present invention. The present weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated iseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Grohn's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, postiated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical process. Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases. properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers Claim 10; Page 14; 72pp; English. Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

Claim 10; Page 14; 72pp; English

MAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include either cell-mediated or antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune hemolytic anaemia, autoimmune cophoritis, autoimmune thyroididis, e.g. multiple sclerosis, contact arthritis, outoimmune thyroididitis, autoimmune uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic mysacedema, myasthenia gravis, perminance, mediated disease, undelayed-type hypersensitivity. The mediated disease, and delayed-type hypersensitivity. The properties which are analogous to glatiramer acetate molecules, which are analogous to glatiramer acetate molecules, which

```
AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer coff the invention are used as molecular weight markers for glatiramer treated tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thrombocytopaenia purpura, collitis, contact sensitivity disease, diabetes mellitus, Garves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, sporiasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersenaitivity. The golypeptides of the invention have defined molecular weights and physical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ï

The molecules are useful as a medicine and in the manufacture of a medicament for the treatment and/or prevention of tumo related disorders. The compounds are able to induce blood clotting at tumour sites resulting in the disruption of the tumour vascularisation and consequently in the control of tumour growth. This sequence represents a heparin-binding peptide, a postively charged polymer that can be incorporated into a substrate for extracellular hydrolases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New tumor-selective intravascular coagulation inducing molecules useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 AKKYAKKEKAYAKKAEKAAKKAEAKAYKABAKKKAKAEAKKYAKAAKAEKKEYAAAEAK

The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The invention provides methods, apparatus and compositions for the detection. The detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule strached to one or more nano-barcodes are allowed to bind to target molecule (8). After binding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). The methods allow the sequencing of long nucleic acid sequences in a single sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low incidence of false positive results.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Macroscopic membrane; cell growth, EAK16; Z-DNA binding protein; zuotin; addical product; suture; artificial skin; internal lining; slow-diffusion drug delivery system; protein-type drug; erythropoietin; haemoglobin; insulin; cell adhesion; cell migration; Alzheimer's disease;
                                                                                                                                                                                          Detecting, identifying and sequencing of biomolecules using controlled alignment of nano-barcodes encoding specific information for scanning probe microscopy, useful in the fields of molecular biology.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      condensing and stabilising a NA. The peptides can be conjugated to a lytic peptide to form a nucleic acid transporter system. The lysis agent forms an alpha-helical structure. The transporter system is used to deliver nucleic acid to a cell and for treating humans by gene therapy. By taking advantage of the characteristics of both the lysis agents and the binding molecules, delivery of the nucleic acid is enhanced. Specific lysis agents are capable of releasing the nucleic acid into the cellular interior from the endosome. Release is efficient without

involves adding a macroscopic membrane that is formed by self-assembly of amphibhilic peptide in an aqueous solution containing monovalent metal cations to a cell culture medium comprising cells, thus forming a membrane/culture mixture, maintaining the mixture under conditions cufficient for cell growth. The invention also relates to EAX16 peptide derived from yeast 2-DNA binding protein (zuotin). Zuotin incorporated into the macroscopic membranes are useful in biomaterial applications such as medical products (e.g., sutures), artificial skin or internal linings, slow-diffusion drug delivery systems supports for in vitro cell growth or culture and support for artificial tissue for in vitro cell conductive biopolymer for culturing cell worldiffusion drug delivery vehicle for delivering protein-type drugs conductive biopolymer for culturing cell monolayers, for promoting cell adhesion and migration, useful as experimental models for Alzheimer's disease and scrapic infection. The present sequence is sea urchin histone HI variant protein. This sequence is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

The invention describes a method of culturing (M1) cells, in vitro. The cell culture involves adding a macroscopic membrane which is formed by self-assembly of amphiphilic peptides in an aqueous solution containing monovalent metal cations, where the peptides have alternating hydrophobic and hydrophilic amino acids and are complementary and structurally compatible, to a cell culture medium comprising cells, thus forming a membrane/culture mixture, and maintaining the mixture under conditions sufficient for cell growth. (M1) is useful for culturing a macroscopic membrane utilised in biomaterial applications e.g., slow-diffusion drug cellivery systems, artificial skin or separation matrices, or as experimental models for Alzheimer's disease and scrapic infection e.g., liver cirrhosis, kidney amyloidosis, or other protein conformational diseases. (M1) enables in vitro culturing of macroscopic membrane that is stable in aqueous solution, serum and ethanol, highly resistant to heat, alkaline and acidic ph, chemical denaturants and proteolytic digestion, and is non-cytotoxic. This is the amino acid sequence of a region found in sea urchin histone H1 delta which is homologous to yeast DNA binding protein zuctin from which amphiphilic peptides capable of forming

controlling metastasis, mediated by systemic macrophages. The peptides can also be used to deliver antigenic peptides as conjugates to a macrophage to macrophage to macrophage to macrophage to macrophage. Also self peptides to prevent tissue transplant rejection. (Updated on 25-MAR-2003 to correct P

WASHINGTON.		316/48.	affinity mannose receptor ligand cpds for treating diseases by macrophage activity e.g. asthma, inflammatory diseases and is diseases, e.g. HIV.	21; 32pp; English.	This compound represents a glycopeptide effective in inhibiting the binding of labelled mannosylated BSA to mannose receptors. Mannose receptors are uniquely found on macrophages and not on monocytes. Glycopeptides such as this provide a mechanism to target macrophages specifically, to image, label, destroy or otherwise alter their antigen specifically, to image, label, destroy or otherwise alter their antigen processing function. In addition they can be conjugated to solid supports and used to purify mannose receptors from a variety of sources. They are useful in the treatment of inflammatory diseases driven by macrophage serretory products eg. Crohn's disease; infectious diseases in which macrophages harbour replicating infectious agents eg. Legionnaires disease; viral infections involving mononuclear phagocytes eg. HIV and lysosomal storage diseases, in which macrophages are principally involved eg. Gaucher's disease; and in in

Novel library of fusion nucleic acids each of which has fused first and second nucleic acids encoding scaffold protein and library peptide having alpha helical biasing sequence, respectively, useful in screening methods.

Example 6; SEQ ID NO 53; 110pp; English.

The invention describes a library (I) of fusion nucleic acids, where each fusion nucleic acid comprises a first nucleic acid (NI), encoding a scaffold protein sequence; and a second nucleic acid (NI), encoding a library peptide sequence comprising an alpha helical biasing sequence; where NI is fused to NI. Disclosed is a method for screening bioactive peptides conferring a change in specific phenotype such as cell morphology, cell growth, cell viability, adhesion to substrates or other morphology, cell growth, cell viability, adhesion to substrates or other RNAs, proteins, lipids, hormones, cytokines, or other molecules; changes in the equilibrium state (i.e., half-life) or one or more RNAs, protein, lipids, hormones, cytokines, or other molecules; etc. The bioactive lipids, hormones, cytokines or other molecules, etc. The bioactive peptide identified by above mentioned method is used to generate more candidate peptides and to identify target molecules, i.e., the molecules

```
combined with other pharmacologic activators to study the epistatic relationships of signal transduction pathways in question. The disclosed method is also useful in cancer applications. Random libraries can be introduced into any tumour cell (primary or cultured), and peptides call death, loss of division or decreased cell growth. The method is also useful for screening of bioactive peptides which restore the constitutive function of the brca-1 or brca-2 genes, and other tumour suppressor genes of the brca-1 or brca-2 genes, and other tumour suppressor genes important in breast cancer such as the adenomatous polyposis coli gene (APC) and the Drosophila disca-large gene (Ing), which are components of cell-cell junctions. The methods are useful in cardiovascular applications, neurobiology applications, bone biology applications, skin biology applications, cosmeceutical applications, endocrinology applications, immunobiology, inflammation, and allergic response applications, immunobiology, inflammation, and allergic response applications, immunobiology, inflammation, and allergic response applications, immunobiology applications. The peptide clibrary can easily be monitored, both for its presence within cells and tractured cellular concentration of peptides having a given structural bias and thus increase the hit rate for targets that bind such structural and allergic structures. This is the manino acid sequence of a protein associated with structures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 67

                                                                                              The invention comprises a library of fusion nucleic acids, where each encoded protein contains a scaffold protein (e.g. a green fluorescent protein - GFP) and a library peptide sequence comprising an alpha helical biasing sequence, or a scaffold protein, a library peptide and a nucleating sequence. The library of the invention is useful for screening bloactive peptides conferring a particular phenotype. The present amino acid sequence represents a library protein containing a nucleating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 3, Application US/09816989A
Sequence 3, Application US/09816989A
Patent No. US20020115103A1
GENERAL INFORMATION:
GENERAL INFORMATION:
THILE OF INVENTION: COPOLYMER I RELATED POLYPEPTIDES FOR USE AS MOLECULAR WEIGHT MARKE
TITLE OF INVENTION: AND FOR THERAPEUTIC USE
FILE REFERENCE: 2609/60807-A-PCT-US
CURRENT APPLICATION NUMBER: US/09/816,989A
CURRENT PLING DATE: 1998-09-25
PRIOR APPLICATION NUMBER: 60/101,693
PRIOR FILING DATE: 1999-09-24
NUMBER OF SEQ ID NOS: 7
SOFTWARE: Patentin version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                APPLICANT: Lis, Doris

Sequence 3, Application US/09816989A

Patent No. 6800287

Patent No. 6800287

APPLICANT: Gad, Alexander

APPLICANT: Lis, Doris

TITLE OF INVENTION: COPOLYMER 1 RELATED POLYPEPTIDES FOR USE AS MOLECULAR WEIGHT MARKI

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

TITLE REFERENCE: 2609/60807-A-PCT-US

CURRENT PAPLICATION NUMBER: 00/99/816,989A

CURRENT FILING DATE: 2001-03-23

PRIOR FILING DATE: 1998-09-25

PRIOR FILING DATE: 1998-09-24

PRIOR FILING DATE: 1999-09-24
                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 AKKYAKKEKAYAK-----AKKAEAK-----AAKKAKAEAKKYAKAAKAEKKEYAAAEAK 49

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 3, Application US/09405743A
Patent No. 6514938
GENERAL INFORMATION:
APPLICANT: Yead Research and Development Co., Ltd.
TITLE OF INVENTION: GLATIRAMER ACETATE MOLECULAR WEIGHT MARKERS
FILE REFERENCE: 60807-A
CURRENT APPLICATION NUMBER: US/09/405,743A
CURRENT FILING DATE: 1999-09-24
NUMBER OF SEQ ID NOS: 7
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 3
LENGTH: 56
                                                                                                                                                                                                                                                                                                                                       1; Indels 11;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.

Claim 10; Page 14; 72pp; English.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides

```
cetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune backers, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myrosdema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, colypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (I) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related terrapolymers. The polypeptides may also be used for treating and preventing immune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating the polyperiors.
                                                                                                                                                                                                                                                                                       diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune opportitis, sutcoimmune thyroiditis, autoimmune thyroiditis, autoimmune thyroiditis, autoimmune uveoretinitis, Crohn's disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Copolymer; molecular weight marker; TV-marker; immune disease; glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidabetic; thyromlmetic; haemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crohn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis; pemphigus vulgaris; systemic lupus erythematosus.

Weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight TV-marker polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetraplymers. The polypeptides may also be used for aseases. Such diseases include either cell-mediated or antibody-mediated diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, contact sensitivity disease, diabetes mellitus, Graves disease, Chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, psoriaais, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The polypeptides of the innext of a treated include host-versus-graft disease proposed the proposed proposed to the innext of the proposed proposed proposed to the proposed proposed proposed proposed proposed to the proposed prop
                                                                                                                                                                                                                         Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                            Claim 10; Page 14; 72pp; English.

AMYREA'L TO AMYREA'LY TEPERSENT SPECIFICALLY CLAIMED CODOLYMET MOLECULAR WEIGHT TWO AMYREA'LY COMPARED FOR THE PRESENT INVENTION GENERALLY CLAIMED AS AN INCIDENTIFIED MOLECULAR WEIGHT AND AND CAT A CORDINGER (EP) WHICH has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer of the invention are used as molecular weight markers for glatiramer of the invention are used as molecular weight markers for glatiramer of the invention are used as molecular weight markers for glatiramer of the invention are used for a mammal. Autoimmune diseases which may be treated include atthritic conditions, demyelinating diseases include arthritic conditions, demyelinating arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune arthritis, autoimmune thrombocytopaenia purpura, colitis, contact cophoritis, autoimmune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Grillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myasthenia gravis, sporiated diseases which can be treated include host-versus-graft disease, and delayed-type hypersensitivity. The graft-versus-host disease, and delayed-type hypersensitivity. The copypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer accetate molecules, which makes them ideal for use as molecular weight markers
                                                                                                                                                                                                                                                                                                                                                                                                                            AAY82571 to AAY82577 represent specifically claimed copolymer molecular
                                                                                                                                                                                                                                                                                                              Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           57.0%; Score 233; DB 3; Length 56; 62.8%; Pred. ```

invention describes tumour-selective intravascular coagulation

inducing molecules. The molecules are useful as a medicine and in the manufacture of a medicament for the treatment and/or prevention of tumour related disorders. The compounds are able to induce blood clotting at tumour sites resulting in the disruption of the tumour vascularisation and consequently in the control of tumour growth. This sequence represents a heparin-binding peptide, a postively charged polymer that can be incorporated into a substrate for extracellular hydrolases releasable by tumour or neoangiogenic endothelial cells

AAY82572 standard; peptide; 45 AA. AAY82572; RESULT 6 AAY82572

28-JUL-2000 (first entry) axxxex

AXY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides [1] for determining the molecular weight invention describes polypeptides [1] for determining the molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatizamer actatate and preventing immune diseases may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases of treated include either cell-mediated or antibody-mediated diseases such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatory complexitis, autoimmune thyroiditis, e.g. multiple sclerosis, contact cophoritis, autoimmune thyroiditis, autoimmune vivocretinitis, contact cophoritis, autoimmune thyroiditis, autoimmune baseolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune servicimune thyroiditis, autoimmune servicimune thyroiditis, disease, Guillain-Barre's syndrome, Hashimoto's disease, idiopathic myxoedema, myaethenia gravis, contact sensitivity disease, disease, idiopathic myxoedema, myaethenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated mediated diseases which can be treated include host-versus-graft disease, cromostides which are analogous to glatizamer acetate molecules, which are analogous to glatizamer acetate molecules, which m • Copolymer; molecular weight marker; TV-marker; immune disease; glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory; antidabetic; thyromimetic; haemostatic; antipsoriatic; dermatological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crohn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis; pemphigus vulgaris; systemic lupus erythematosus. 1 AKKYAKEKAYAKKAEKAAKKAEAKYYAAEAKKKAKAEAKKYAKAAKAEKKEYAAAEAK 60 Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:2. 41; 30.9%; Score 126.5; DB 3; Length 45; 45.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a library (I) of fusion nucleic acids, where each fusion nucleic acid comprises a first nucleic acid (NI), encoding a caffold protein sequence; and a second nucleic acid (NI), encoding a library peptide sequence; and a second nucleic acid (NI), encoding a library peptide sequence; and a second nucleic acid (NI), encoding a library peptide sequence; and second nucleic acid (NI), encoding a classification of sequence; where NI is fused to N2. Disclosed is a method for screening bioactive peptides conferring a change in specific phenotype such as cell morphology, cell growth, cell viability, adhesion to substrates or other cells, and cellular density; changes in the expression of one or more RNAs, proteins, lipids, hormones, cytokines, or other molecules; ctc. The bioactive peptide identified by above mentioned method is used to generate more candidate peptides and to identify target molecules; etc. The bioactive peptide interacts. The peptide(s) can be combined with other pharmacologic activators to study the epistatic colling also useful in cancer applications. Random libraries can be cintroduced into any tumour cell (primary or cultured), and peptides cintroduced into any tumour cell (primary or cultured), and peptides division or decreased cell growth. The method is also useful for corresponded cell growth. The method is also useful for corresponded cell growth. The method is also useful for introduced into any tumour cell (primary or cultured), and peptides which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The method is also useful for corresponded cell growth. The method is also useful for introduced into any tumour suppressor genes coll important in hereat cancer such as the adenomateus polyposis coll gene cell important in hereat cancer such as the adenomateus polyposis coll gene cell important in hereat cancer such as the adenomateus polyposis coll genes in a more cell prince of the processor genes and coll cell cell cell cell cell ce

The invention comprises a library of fusion nucleic acids, where each encoded protein contains a scaffold protein (e.g. a green fluorescent protein - GFP) and a library peptide sequence comprising an alpha helical biasing sequence, or a scaffold protein, a library peptide and a nucleating sequence. The library of the invention is useful for screening bloactive peptides conferring a particular phenotype. The present amino acid sequence represents a library protein containing a nucleating

The invention describes a library (I) of fusion nucleic acids, where each fusion nucleic acid comprises a first nucleic acid (NI), encoding a caffold protein sequence; and a second nucleic acid (N2), encoding a library peptide sequence comprising an alpha helical biasing sequence; where NI is fused to N2. Disclosed is a method for screening bloactive peptides conferring a change in specific phenotype such as cell compromed. Compared to N2. Disclosed is a method for screening bloactive peptides conferring a change in specific phenotype such as cell compared to N2. Disclosed is a method for screening bloactive. Cells, and cells, and cells, changes in the expression of one or more RNAs, proteins, lipids, hormones, cytokines, or other molecules; changes in the equilibrium state (i.e., half-life) or one or more RNAs, protein, lipids, hormones, cytokines, or other molecules; etc. The bioactive peptide identified by above mentioned method is used to generate more candidate peptides and to identify target molecules, i.e., the molecules with which the bioactive peptide interacts. The peptide(s) can be combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined with other pharmacologic activators to study the epistatic combined method is also useful in cancer applications. Random libraries can be

2;
introduced into any tumour cell (primary or cultured), and peptides identified which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The method is also useful for screening of bioactive peptides which restore the constitutive function of the brca-1 or brca-2 genes, and other tumour suppressor genes
                                                                              of the broad or broad genes, and other tumour suppressor genes important in breast cancer such as the adenomatous polyposis coli gene (ARC) and the brosophila discs-large gene (Dig), which are components of cell-cell junctions. The methods are useful in cardiovascular applications, neurobiology applications, bone biology applications, skin applications, infectious disease applications, drug toxicities and drug resistance applications immunobiology, inflammation, and allergic response applications, and biotechnology applications. The peptide library can easily be monitored, both for its presence within cells and its quantity. The expression of structurally biased libraries generate elevated cellular concentration of peptides having a given structural bias and thus increase the hit rate for targets that bind such bias and thus increase the hit rate for targets that bind such bias and thus increase the hit rate for targets that bind such bias and thus increase the hit rate for targets that bind such bias and thus how the concentration of the periods are provedured.
                                                                                                                                                                                                                                                                                                                                                                  structures. This is the amino acid sequence of a protein associated with fused nucleic acid and random peptide libraries of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       7 KEKAYAKKAEKAAKKAEAKA----YKAAEAKKKAKAEAKKYAKAAKAEKKEYAAAEAKYK 62

               The invention comprises a library of fusion nucleic acids, where each encoded protein contains a scaffold protein (e.g. a green fluorescent protein - GFP) and a library peptide sequence comprising an alpha helical biasing sequence, or a scaffold protein, a library peptide and a nucleating sequence. The library of the invention is useful for screening bioactive peptides conferring a particular phenotype. The present amino acid sequence represents a library protein containing a nucleating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 12 AKKAEKAAKKAEAKAYKAABAKKKAKAEAKKYAKAAKAEKKEYAAAEAKYKAEAAKKAYK 71
                                                                   tumor-selective intravascular coagulation inducing molecules useful
                                                                                                                                                                                                                                                                            inducing molecules. The molecules are useful as a medicine and in the manufacture of a medicament for the treatment and/or prevention of tumo related disorders. The compounds are able to induce blood clotting at tumour sites resulting in the disruption of the tumour vascularisation and consequently in the control of tumour growth. This sequence represents a heparin-binding peptide, a postively charged polymer that can be incorporated into a substrate for extracellular hydrolases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Structurally biased random peptide library related protein seqid 15.
                                                                                                                                                                                                                                              invention describes tumour-selective intravascular coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
                                                                          C fusion nucleic acid comparises a first nucleic acid (N1), encoding a caffeld protein sequence; and a second nucleic acid (N2), encoding a caffeld protein sequence; and a second nucleic acid (N2), encoding a library peptide sequence; and a second nucleic acid (N2), encoding a library peptide sequence; and a second nucleic acid (N2), encoding a library peptide sequence comprising a change in specific phenotype such as cell encyphology, cell growth, cell viability, adhesion to substrates or other morphology, cell growth, cell viability, adhesion to substrates or other morphology, cell growth, cell viability, adhesion to substrates or other morphology, cell growth, cell viability, adhesion to substrates or other molecules; in the equilibrium state (i.e., half-life) or one or more RNAs, protein, cells, and cellular density; changes in the expression of one or more RNAs, proteins, lipids, hormones, cytokines, or other molecules; i.e., the molecules in the equilibrium state (i.e., half-life) or one or more RNAs, protein, cell identified by above mentioned method is used to generate more peptide interacts. The peptide (s) can be with which the bioactive peptide interacts. The peptide(s) can be candidate peptides and to identified which by themselves induce apoptications. Random libraries can be method is also useful in cancer applications, Random libraries can be introduced into any tumour cell (primary or cultured), and peptides method is also useful for division or decreased cell growth. The method is also useful for division or decreased cell growth. The method is also useful for compensing of bioactive peptides which restore the components of the broa-1 or broa-2 genes, and other tumour suppressor genes (RNC) and the brosophila discalars, and other tumour suppressor genes (ARC) and the brosophila discalars, and other tumour suppressor gene (RNC) and the brosophila discalars, manuology applications, and brocenhology applications, and brocenhology applications, and brocenhology applications, and brocenhology applic
                                                                   The invention describes a library (I) of fusion nucleic acids, where each

The invention comprises a library of fusion nucleic acids, where each encoded protein contains a scaffold protein (e.g. a green fluorescent protein - GFP) and a library peptide sequence comprising an alpha helical biasing sequence, or a scaffold protein, a library peptide and a nucleating sequence. The library of the invention is useful for screening bioactive peptides conferring a particular phenotype. The present amino acid sequence represents a library protein containing a nucleating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fusion nucleic acid library; scaffold protein; bioactive peptide; phenotype change; cell morphology; cell growth; cell viability; cell adhesion; cellular density; cancer; tumour; apoptosis; cell death; loss of cell division; decreased cell growth; brca-1; brca-2; tumour suppressor gene; breast cancer; adenomatous polyposis coli; APC; brosophila discs-large, DIg; cardiovascular; neurobiology; bone biology; skin biology; cosmeceutical; endocrinology; infectious disease; drug toxicity; drug resistance; inflammation; allergic response;

the invention describes a library (1) of tusion nucleic acid.

the invention describes a library (1) of tusion nucleic acid (N2), encoding a scaffold protein sequence; and a second nucleic acid (N2), encoding a clibrary peptide sequence comprising an alpha helical biasing sequence; where NI is fused to N2. Disclosed is a method for screening bicactive peptides conferring a change in specific phenotype such as cell controlled to the sequence; peptides conferring a change in specific phenotype such as cell controlled to the sequence of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  structures. This is the amino acid sequence of a scaffold protein used in peptide libraries ot hold the library peptide in a conformationally
                                                                                                                                                                                                                                                                                                 Novel library of fusion nucleic acids each of which has fused first and second nucleic acids encoding scaffold protein and library peptide having alpha helical biasing sequence, respectively, useful in screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention describes a library (I) of fusion nucleic acids, where each

The invention comprises a library of fusion nucleic acids, where each encoded protein (e.g. a green fluorescent protein contains a scaffold protein (e.g. a green fluorescent protein - GFP) and a library peptide sequence comprising an alpha helical biasing sequence, or a scaffold protein, a library peptide and a nucleating sequence. The library of the invention is useful for screening bioactive peptides conferring a particular phenotype. The present amino acid sequence represents a scaffold protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ----YKAAEAKKKAKAEA 40

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
